**Tuberculosis skin test**

- The TB skin test is also called the Mantoux test (TST).
- The TB skin test is performed by inserting a small amount of tuberculin into the skin on the lower part of the forearm.
- A person given the tuberculin skin test should not be asked to bathe, use cosmetics, or wear jewelry on the arm.
- The result depends on the size of the reaction, known as the induration.
- A positive skin test indicates that the person has been infected with TB bacteria at some point in their life.
- A negative skin test does not mean the person is free of TB. It only means that the person's immune system has not reacted to the TB bacteria.
